TURRET OS: Multi-Layered Graph and Rule-AST Architecture Rescuing Insider Threat Detection Against Out-of-Distribution Adversaries

Target Journal: *Forensic Science International: Digital Investigation* (Elsevier)

Ali Hamza is a cybersecurity researcher with the Department of System Security and Software Engineering at the National University of Sciences and Technology (NUST), Islamabad, Pakistan. His research interests focus on system-level security architecture, digital forensic readiness standards (ISO/IEC 27043), W3C-PROV provenance knowledge graphs, out-of-distribution machine learning robustness, and graph neural network fusion. He has led the architectural design and experimental implementation of multi-layered insider threat detection systems.

Ghulam Mujtaba is a computer science and cybersecurity researcher at the National University of Computer and Emerging Sciences (FAST-NUCES), Islamabad, Pakistan. His research focuses on graph representation learning, automated grammar-driven rule engines, high-throughput security telemetry ingestion, and enterprise threat intelligence. He has contributed to the graph topological representation and rule-AST evaluation engines for complex system activity analysis.
